ISUZU

Founded in 1916, Isuzu Motors is Japan's longest-running commercial vehicle manufacturer and the world's leading manufacturer of commercial vehicles and industrial engines. It was 1934 when Tokyo Ishikawajima Shipbuilding & Engineering Co. Ltd merged with Dot Automobile Manufacturing Inc. and took on the new name of Automobile Industries Co., Ltd. The company became the subject of interest of the Japanese government who then proposed to give the main car a brand new name. The name chosen was Isuzu, after the Isuzu river that flows through the Ise Grand Shrine and to which many traditional songs and poems are dedicated.

The very first Isuzu pick-up dates back to the early 1960s.

By the beginning of the eighties, the Isuzu brand was officially recognized worldwide: the Isuzu Pick-up starts to become known to the general public.

In 1986, Isuzu achieved the export of 3 million units.

The nineties marked the success of Pick-Up sales. As part of a general corporate reorganization, the new Isuzu D-Max Pick-Up was officially launched on the Thai market in May 2002 and quickly reached their sales record. Marketing of the D-Max began in Europe the following year. Since 2004, Isuzu has been recognized as the world leader in pick-up production.

2012 saw the relaunch of the D-Max: in June the D-Max "All New" generation entered the European market.

So, we have now come to celebrate 60 years of ISUZU in the Pick-up world!

ISUZU

THE FUTURE IS NOW

With the new D-Max Single N60B, ISUZU wants to be a benchmark in the Pick-Up market with a payload of 1 ton.

A completely revised exterior and interior design, substantial innovations to the engine, gearbox, chassis, bodywork, Infotainment system and advanced safety and driving aid systems, without leaving aside the Off-Road capabilities which have also been further improved.

With ADAS safety systems, the future is now!

ISUZU
D-MAX

POWERFUL AND GREEN

ENGINE

Straight-four with dual overhead camshaft and 16v, timing chain and common rail electronic injection. Electro-actuated variable geometry turbocharger, water cooled intercooler and exhaust gas recirculation via dual EGR cooler.

The new D-Max Single N60B engine has kept the architecture of the previous model as well as the reliability that has always set ISUZU engines apart.

The power and torque values are unchanged but a series of latest generation technical innovations (Start&Stop, low pressure EGR system, SCR system...), alongside an increase in maximum fuel injection pressure by 25%, further improves the efficiency by minimizing fuel consumption and NOx and CO2 emissions.

(WLTP) values are*:

- CO2 (Combined Cycle) on 4x2 M/T gearbox is 212 g/km and 8,1 l/100km fuel consumption;

- CO2 (Combined Cycle) on 4x4 M/T gearbox is 216 g/km and 8,2 l/100km fuel consumption.

The 14.5-liter, low-consumption AdBlue® tank guarantees excellent overall autonomy.

ISUZU always pays special attention to the environment: the new D-Max Single N60B has a recycling rate of 92% and a potential recovery rate of 99.6%.

Power: 120 kW (164 CV) /3600 rpm #

Torque: 360 Nm /2000-2500 rpm #

Emissions: Euro 6d

#ISO NET

* The standard WLTP procedure, which replaced the previous NEDC (for the measurement of exhaust emissions and consumptions), provides new test conditions that more realistically reflect the actual conditions of use of the vehicle.

The fuel consumption and CO2 emissions measured according to this new test cycle are in many cases higher than those measured according to the NEDC cycle.

Please note that in addition to engine performance also driving style and other non-technical factors determine fuel consumption and CO2 emissions.

The graph shows the characteristic curves of Power in red and Torque in blue of the RZ4E engine

ISS (Idling Start & Stop)

The reduction in fuel consumption also comes from here; the electrical system (alternator, starter motor and battery) has been designed to ensure maximum operational reliability. NB: The air conditioning works even when the Start&Stop function is active.

LP-EGR

LP-EGR (Low Pressure EGR)

The EGR system is the only system that reduces NOx production during the combustion phase. With the addition of low-pressure exhaust gas recirculation, the overall efficiency is significantly higher than a classic EGR system.

SCR

SCR (Selective Catalytic Reduction)

this exhaust gas after-treatment system, initially developed for the Truck world, is combined with the LNT system (Lean NOx Trap, introduced on the previous version of D-Max) and allows for optimal efficiency in reducing NOx.

WADING

CAPABILITY

The new D-Max N60 Single B, does not deny its origins; the off-road vehicle stays in its natural habitat. The minimum ground clearance, the intake system and the rear differential breather have been redesigned and ensure a wading capacity of 800mm on the new D-Max N60 Single.

Available in two versions

4x2

4x4

MAXIMUM

DEPTH: 800mm

HDC
Hill Descent Control

HSA
Hill Start Assist

TCS
Traction control system

WADING

CAPACITY

Towing capacity of 2,500 kg (4x2), 3500 kg (4x4). The first gear of the manual transmission is designed very short so as to start easily under any load condition, even on the steepest of hills.

The new TSC function allows you to safely tow a trailer even at high cruising speeds, by automatically acting on the braking system of your D-Max to reduce vibrations caused by external forces on the trailer (eg side wind)".

COMFORT

BEHIND THE WHEEL

The cab, chassis and suspension structures have been revised. The structural elements of the cab are built with high-strength steels thus combining lightness and strength.

The chassis comes with an additional cross bar to increase safety in the event of side collisions, as well as bigger cross members; the torsional stiffness of the frame also boasts a 20% increase.

The cab mounts are a new type (shear) and guarantee a leap forward in driving comfort; vibrations and roughness of the road are optimally damped. The overall soundproofing characteristics of the passenger compartment (from external noise and aerodynamic rustling) have been revolutionized thanks also to new internal seals on the doors and centre pillar, in addition to new insulation materials.

16

N 60 B
NAMIBIA
SINGLE **4x2/4x4**

Suspension

The front (independent) and rear (leaf spring) suspensions have undergone improvements: the upper triangle of the front suspension has been repositioned higher to reduce roll when cornering, and the rear three-leaf suspension is more comfortable with a different calibration of the shock absorbers.

Front brakes

The front brake discs are ventilated and bigger (diameter +20mm) compared to the previous model.

Tires

The standard tires on the new D-MAX N60 are wider (265mm) than the previous model (255mm). The Low Rolling Resistance technology saves fuel by ensuring optimal grip even in unfavorable ground conditions thanks to the innovative tread design.

Rear brakes

The rear brakes are drum. This mixed braking system (disc and drum) allows you to combine the advantages of both technical solutions whilst also ensuring excellent braking capacity even under full load conditions.

STUNNING

EXTERIOR

18

Robust and reliable

Available in 4x2 or 4x4 versions, the new ISUZU D-Max Single N60B is your ideal workhorse. The new, more aggressive design, the increased body height and the new more aerodynamic lines mean that both fuel consumption and aerodynamic vibrations at high speed are contained.

NEW INTERIOR

Details

New design. More space in the cab with easier entry and exit. Interior comfort. Multiple adjustments to the driver seat (new lumbar and height adjustment). Steering wheel height and depth adjustment with steering wheel controls. All of this allows you that comfortable driving condition you've been looking for!

NB: Standard equipment may vary depending on the model chosen.

22

New instrument cluster with color display.

Electric power steering. Steering assistance is better in all driving conditions: at low speeds (lighter steering) and high speeds (harder steering), thus increasing driving comfort and safety. Another great advantage is that there is no routine maintenance on the power steering components.

Seat tilt adjustment.

TILT & TELESCOPIC STEERING WHEEL

Steering wheel height and depth adjustment.

PASSIVE SAFETY

You are always at the forefront

As with our entire range, the ISUZU D-Max Single N60B also features the most advanced safety technologies: Anti-lock braking system (ABS), Electronic Stability Control with TCS, Front Collision Warning (FCW), Autonomous Emergency Brake (AEB), Traffic Sign Recognition (TSR), Manual Speed Limiter (MSL), Intelligent Speed Limiter (ISL), Driver Monitoring, Line Departure Warning System (LDWS), Line Departure Prevention (LDP), Multi Collision Brake and the emergency call e-Call are all included in the D-Max Single N60B series.

24 ISUZU D-Max Single N60B is also equipped with steering wheel controls that integrate the radio, bluetooth hands-free kit to manage phone calls and to set the Cruise Control or speed limiter. The new chassis with the addition of a new cross bar increases safety in the event of side collisions. The increase in size of the side cross members also increases the torsional rigidity of the chassis by 20%.

PASSIVE SAFETY

INTERIOR

The Airbag equipment is richer: all models are equipped with the driver's knee airbag. ISUZU D-max Single N60B models are equipped with 7 Airbags.

7 Airbags

Passenger airbag can be deactivated

ESS: Emergency Stop Signal, in the event of emergency braking, the indicators flash to warn rear vehicles of a dangerous situation

26

Built to last

The structure of the cab, chassis and suspension has been revised and now the D-Max Single N60B features a passenger compartment and a load compartment built with ultra-high-strength steels and new progressive deformation points, thus combining lightness and strength.

The towing capacity of the 4X4 version is 3500 kg (with braked trailer) and the maximum mass allowed on the axles has also increased: +100 kg front and +40 kg rear*.

The towing capacity of the 4X2 version is 2500 kg (with braked trailer) and the maximum mass allowed on the axles has also increased: +200 kg front and +40 kg rear*.

MODERN

PRACTICAL

Battery saving function

When the ignition is off, the dipped headlights and sidelights turn off automatically (to avoid draining the battery) as soon as the driver's door is opened or as soon as all the doors are locked via remote control.

Cruise control

Allows you to set the vehicle's cruising speed (in increments of 1 km/h) to facilitate more comfortable and safe driving.

Follow me home

By moving the headlight lever forward when the ignition is off, the vehicle temporarily activates the dipped headlights and sidelights (for 30 seconds) to light the area around the vehicle.

PICK-UP

LOADING CAPACITY

The total ground mass increases to 3100kg for models with all-wheel drive (+ 100kg) *. This means you are able to maintain a record payload of over 1 ton regardless of a slight increase in the tare weight of the vehicle.

*Compared to previous model
